ô

```
cancer predisposing gene HPC2, which is found on chromosome 17p. Some alleles of this gene cause a predisposition to cancer, particularly prostate cancer. This protein and its gene can be used in peptide and gene therapy for cancer patients, as well as being useful as diagnostic tools (both for cancer sufferers and those with a predisposition to the disease) and in the production of cancer drugs.
                                                                                                                                                                                                                                                                                                                                            LSGMILTLKETGLPKCVLSGPPQLEKYLEAIKIFSGPLKGIELAVRPHSAPEYEDETMTV 180

It belongs to a family sequence similarity to a sulphatase from the marine bacterium Alteromonas carrageenovora. The hSG gene contains 23 exons and is located at chromosome 17p11.2. The nucleotide sequence encoding this protein was identified in clone lambda29.1 of a human testes CDNA library. The clone was isolated using human EST sequences with sequence similarity to the non-CTPSR family as a probe to screen the library. The clone has subcloned and the DNA sequence of both strands was determined. hSG nucleotide and polypeptide sequences may be used to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    240

AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; costeopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimilant; cardiant; thrombolytic; coaqulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidianemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy crotice acids can be used to express ORFX proteins in gene therapy proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic annemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antinifiammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   240

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comptrises: (a) an oligo-dT primer and an oligounclectide complementary to the complementary strand of a polynuclectide which comprises one of the 5602 nuclectide comprises at least 15 nuclectides; or (b) a combination oligonuclectide comprises at least 15 nuclectides; or (b) a combination of an oligonuclectide comprises a least 15 nuclectides; or (b) a combination of sequence and an oligonuclectide comprises a 3'-end sequence complementary to the compliance of the comprises a 3'-end sequence complementary to a polynuclectide which comprises a 3'-end sequence defined in the 5'-end sequence/3'-end sequence is selected from those defined in the 5'-end sequence/3'-end sequence is selected from those defined in the 5'-end sequence/3'-end sequence is selected from those defined in the formation of the 5'-end sequence of the primers are also useful for the particularly full-length cDNAs. The primers are also useful for the particularly full-length cDNAs. The primers are also useful for the contact of the full-length but any specialised methods. AAH13613 to AAH136
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the
                                                                              480
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; primer; detection; diagnosis; antisense therapy; gene therapy.

                                                                                                                                                                                                                   The present sequence is the protein produced from the murine prostate cancer predisposing gene HPC2, the human homologue of which is found on chromosome 17p. Some alleles of this gene cause a predisposition to cancer, particularly prostate cancer. This protein and its gene can be used in peptide and gene therapy for cancer patients, as well as being useful as diagnostic tools (both for cancer sufferers and those with a predisposition to the disease) and in the production of cancer drugs.
                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                    Human prostate cancer (HPC)2 nucleic acids, polypeptides, and antibodies, useful for treatment and diagnosis of prostate cancer

Immunostimulant; antiinflammatory; cardiant; vulnerary; antiulcer; notropic; antiinflammatory; cardiant; vulnerary; antiulcer; antibartaint; antiparastic; chromobylvic; antiboqualmt; polynucleotides can be used in gene therapy and as vaccines, proteins and angiogenesis- modulators. The human secreted proteins and polynucleotides can be used for diagnosing (the susceptibility to) a pathological condition by determining the presence or amutation in the polynucleotide or determining the presence presence or a mutation in the polynucleotide or determining the presence presence or amount of expression of the protein. The polynucleotides and proteins can also be used in the treatment and diagnosis of cancer,
                                                                                                                                                                                                                                                                                                                                                                                                  Human; secreted protein; immunosuppressive; immunostimulant; nootropic; antinoframatory; cardiant; vulnerary; antiulocry; antinoovulasant; antiparkinsonian; neuroprotective; antivoral; antiparasitic; thrombolytic; anticoagulant; antiarteriosclerotic; antiparasy; vaccine; chemotaxis-modulator; antiarteriosclerotic; cancer; immune system disorder; hyperproliferative disorder; infection; cardiovascular disorder; neurological disease; wound healing;
can be used in the treatment of cancer, psoriasis and restenosis. This ibecause they can be used to identify plant, insect and human homologues of the yeast genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The polynucleotide sequences given in AAA87666 to AAA87708 encodes the human secreted proteins given in AAB2565 to AAB25755. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Examples of activities include: immunosuppressive;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated polynucleotide encoding a secreted protein useful for preventing, treating or ameliorating a medical condition -

These are essential for the germination and proliferation of Saccharomyces cerevisiae, and include YKR081C, YFR003C, YGR277C, YGR277B, YKR071C, YKR075C and YKR083C. The sequences can also be used to identify compounds for use as herbicides, insecticides and anti-proliferation drugs which

The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antirheumatic; antiarthritic; antidiametory: antithyroid; antialerqic; antibacterial; antiviral; dermatological: neuroprotective; cardiant; thrombolytic; coaqulant; nootropic; vasotropic; antipsoriatic and antiangiogenic. The polymucleotides and polymeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polymucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating
                cardiovascular disorders and neurological disease. They can also be used to promote wound healing and to fight infection. AAA87657 to AAA87665 and AAB25664 represent sequences used in the exemplification of the present

The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal cancers and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the

The polypeptides can be expressed by standard recombinant methodology. The PP are useful for treating a disease or
                                                                                                                                                                                                      nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholosterol ester storage, systemic lupus bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel phosphatases useful for treating diseases associated with decreased expression of functional phosphatases, e.g., Alzheimer's disease, Huntington's disease, immune disorders, and cancers

condition associated with decreased expression of functional phosphatases. Compositions containing agonists or antagonists of PP may be used to treat a disease associated with decreased expression or overexpression of PP, respectively. Such diseases may include Alzheimer's disease, Huntington's disease, immune disorders, and cancers. The present sequence represents a human phosphatase.
                                                                                                                                                                                       Gaps

/issue_type="primary B-cells from tonsils (cell line)"
/lab_host="primary B-celsstant)"
/lab_host="DH10B (phage-resistant)"
/note="Organ: B-cells; Vector: porB7; Site_1: XhoI;
Site_2: EcoR1; cDNA made by oligo-dT priming.
Directionally cloned into EcoR1/XhoI sites using the
following 5' adaptor: GGCACGAG(G). Size-selected >500bp
for average insert size 1.8kb. Library constructed by Ling
Hong in the laboratory of Gerald M. Rubin (University of
California, Berkeley) using ZAP-cDNA synthesis kit
(Stratagene) and Superscript II RT (Life Technologies).
Note: this is a NIH_MGC Library."

Result No.

The present sequence is the coding sequence of the human prostate cancer predisposing gene HPC2, which is found on chromosome 17p. Some alleles of this gene cause a predisposition to cancer, particularly prostate cancer. This gene and its protein can be used in peptide and gene therapy for cancer patients, as well as being useful as diagnostic tools (both for cancer sufferers and those with a predisposition to the disease) and in the production of cancer drugs. This sequence was isolated by cloning and sequencing the region of the genome which appeared to cause a predisposition to prostate cancer. (HPC)2 nucleic acids, polypeptides, and treatment and diagnosis of prostate cancer Page 98-100; 157pp; English (HPC)2 antibodies, useful for cancer prostate Claim 3; Human

replacing, repairing, or compensating for a DNA sequence within that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence encodes human sulphatase G (hSG). hSG is not a member of the well-characterised CTPSR sulphatase family. It belongs to a family showing sequence similarity to a sulphatase from the marine bacterium Alteromonas carrageenover. The hSG gene contains 23 exons and is located at chromosome 17pll.2. The present sequence is clone lambda29.1 from a human testes cDNA library. It was isolated using human EST sequences with sequence similarity to the non-CTPSR family as a probe to screen the library. The cDNA insert was subcloned and the DNA sequence of both strands was determined. The sequence may be used to treat a patient suffering from hSG deficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         360

full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs.

Claim 8; SEQ ID 11557; 2537pp + CD ROM; English

The present invention describes primer sets for synthesising 5602
full-length cDNAs defined in the specification. Where a primer set
comprises: (a) an oligo-dr primer and an oligonucleotide comprises one of
the complementary strand of a polyuucleotide which comprises one of
the 5602 nucleotide comprisines at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprising a sequence complementary to the
complementary strand of a polyuucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to the
complementary strand of a polyuucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence of polyuucleotide which comprises a 1'-end sequence of more those defined in
complementary the primer sets is selected from those defined in
the specification. The primer sets can be used in antisense therapy and
in gene therapy. The primers are useful for synthesising polyuucleotides,
the full-length cDNAs. The primers are also useful for the
cdetection and/or diagnosis of the abnormality of the proteins encoded by
the full-length cDNAs. The primers allow obtaining of the full-length
cC CNNAs easily without any specialised methods. AAH03616 to AAH13628 and
AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to
AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632
crepresent oligonucleotides, all of which are used in the exemplification the present invention.

The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; sequences have activities such as: cytostatic; hepatotropic; vulnerary; catigorialic; antiparkinsonian; nootropic; neuroprotective; costeopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coaqulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; antidiabetic; and antianaemic. The sequences can be used for determining the presence of or predisposition to or preventing or treating the presence of our predisposition to or preventing or treating the presence of out predisposition associated with an ORFX associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy coetors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthitis, graft vs host disease, cardiovascular disease, diabetes mellitus, chylenatosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, alleaties, aplastic annemia, but wounds, bone and cartilage damage, nocturnal haemoglobinuria, antinificamenda as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   frame

                                                                                                                                                                                                                                                                                                                                                     Key
                                                                                            AAA60207
                                                                           RESULT
                                                                                                                                                  The present invention describes primer sets for synthesising 5602
full-length cDNAs defined in the specification. Where a primer set
comptises: (a) an oligo-dT primer and an oligouncleotide comptiementary
to the complementary strand of a polynucleotide which comprises one of
the 5602 nucleotide comprises at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprises a 3'-end sequence complementary to the
oligonucleotide which comprises a 1'-end sequence, where the
oligonucleotide comprises a 1'-end sequence, where the
oligonucleotide comprises a 1'-end sequence, where the
oligonucleotide comprises as 1'-end sequence, where the
oligonucleotide comprises a 1'-end sequence, where the
oligonucleotide comprises of the abnormality of the full-length cDNAs. The primers are also useful for the
connection and/or diagnosis of the abnormality of the proteins encoded by
the full-length cDNAs. The primers allow obtaining of the full-length
cDNAs easily without any specialised methods. AAH33639 and
AAH13633 to AAH13642 represent human amino acid sequences; and AAH3639
crepresent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ·

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is the genomic sequence of the human prostate cancer predisposing gene HPC2, which is found on chromosome 17p. Some alleles of this gene cause a predisposition to cancer, particularly prostate cancer. This gene and its protein can be used in peptide and gene therapy for cancer patients, as well as being useful as diagnostic tools (both for cancer sufferers and those with a predisposition to the disease) and in the production of cancer daugs. This sequence was isolated by cloning and sequencing the region of the genome which appeared to cause a predisposition to prostate cancer.

                                                                                  the human colorectal adenocationma (colon cancer) cell line SW480. The CDNA clones can be used to generate antisense oligonucleotides which can be used for antisense therapy. Methods and products from the present invention can be used for identifying and/or classifying cancerous cells present in a human tumour, particularly in solid tumours, e.g. carcinomas and sarcomas, e.g. breast or colon cancers. The CDNA clones can be used for developing agents for the diagnosis and treatment of disorders involving unwanted cell proliferation, such as neoplasia,
                                                                 AA279917 to AAZ80766 represent double stranded cDNA clones isolated from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ω
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is the coding sequence of the murine prostate cancer predisposing gene Mm. HPC2, the human homologue of which is found on chromosome 17p. Some alleles of this gene cause a predisposition to cancer, particularly prostate cancer. This gene and its protein can be used in peptide and gene therapy for cancer patients, as well as being useful as diagnostic tools (both for cancer sufferers and those with a predisposition to the disease) and in the production of cancer drugs.

The present sequence is part of the coding sequence of a variant of the human prostate cancer predisposing gene HPC2, which is found on chromosome 17p. This variant has been designated 1641nsG. Some alleles of this gene cause a predisposition to cancer, particularly prostate cancer, this allele being an example of this. The HPC2 gene and its protein can be used in peptide and gene therapy for cancer patients, as well as being useful as diagnostic tools (both for cancer sufferers and those with a predisposition to the disease) and in the production of cancer drugs. This sequence was isolated by mutation screening of the HPC2 gene in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping; ss.
